

Practical Implementation of Map Algebra

Yangyu Li | yangyu.li@stud.plus.ac.at

Agenda

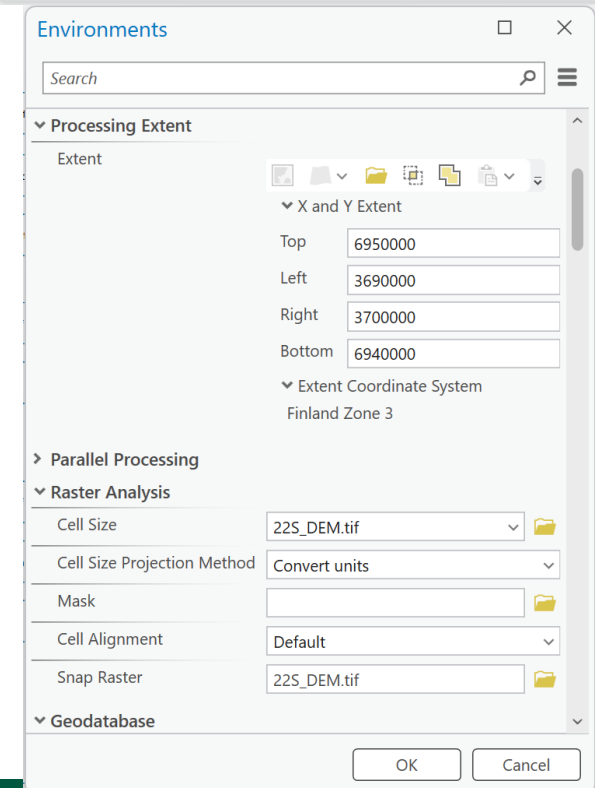

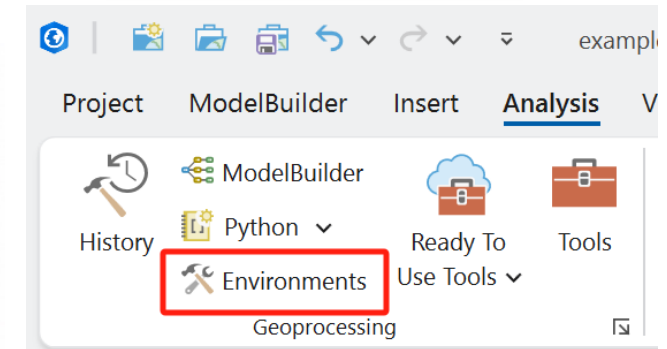

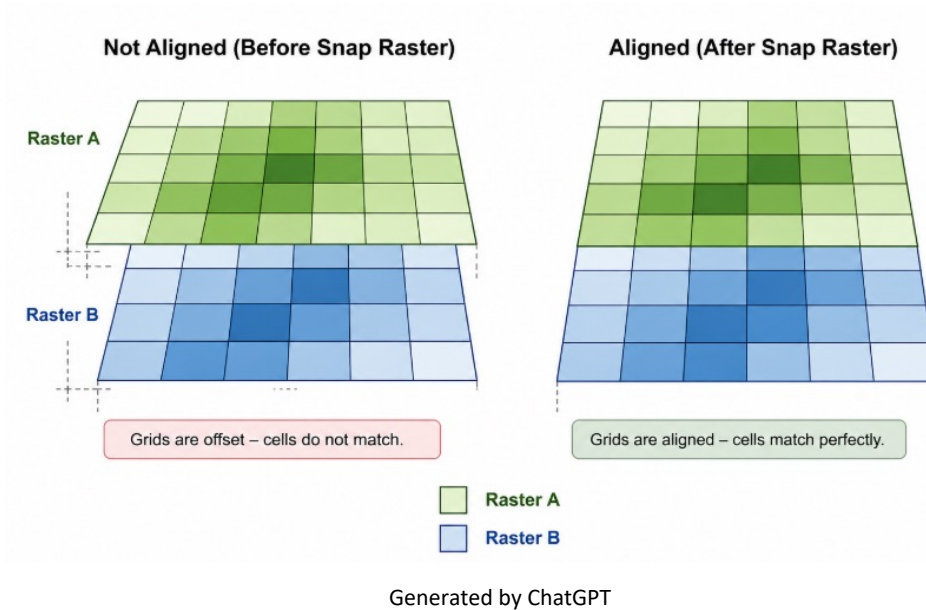

1. Scope
2. Environments setting
3. Expression-based implementation
4. Tool-based implementation
5. Workflow-based implementation
6. Script-based implementation
7. Example: ModelBuilder vs. ArcPy
8. Strength and limitations
9. Why open-source implementation matters
10. GEE case study
11. Conclusion

Scope

- ❖ Focus on implementation, not on application domains
- ❖ How Map Algebra is implemented in different environments
- ❖ Mainly Focus:
 - ❖ Spatial analysis tools (ArcGIS Pro)
 - ❖ ModelBuilder (ArcGIS Pro)
 - ❖ ArcPy (ArcGIS Pro)
 - ❖ QGIS
 - ❖ GRASS GIS
 - ❖ Open-source Python packages

Environment settings

- Cell size
- Extent
- Snap raster
- Mask
- NoData propagation
- Edge handling
- ...

Main implementation modes

- ❖ Expression-based implementation
 - ❖ Direct raster calculation expressions

- ❖ Tool-based implementation (Spatial analysis tools)
 - ❖ Focal statistics
 - ❖ Reclassify
 - ❖ Zonal statistics
 - ❖ Distance tools
 - ❖ ...

Main Implementation modes

- ❖ Workflow-based implementation
 - ❖ ModelBuilder
 - ❖ Chained geoprocessing tools

- ❖ Script-based implementation
 - ❖ ArcPy
 - ❖ PyQGIS
 - ❖ Python expressions and automated workflows

Expression-based implementation

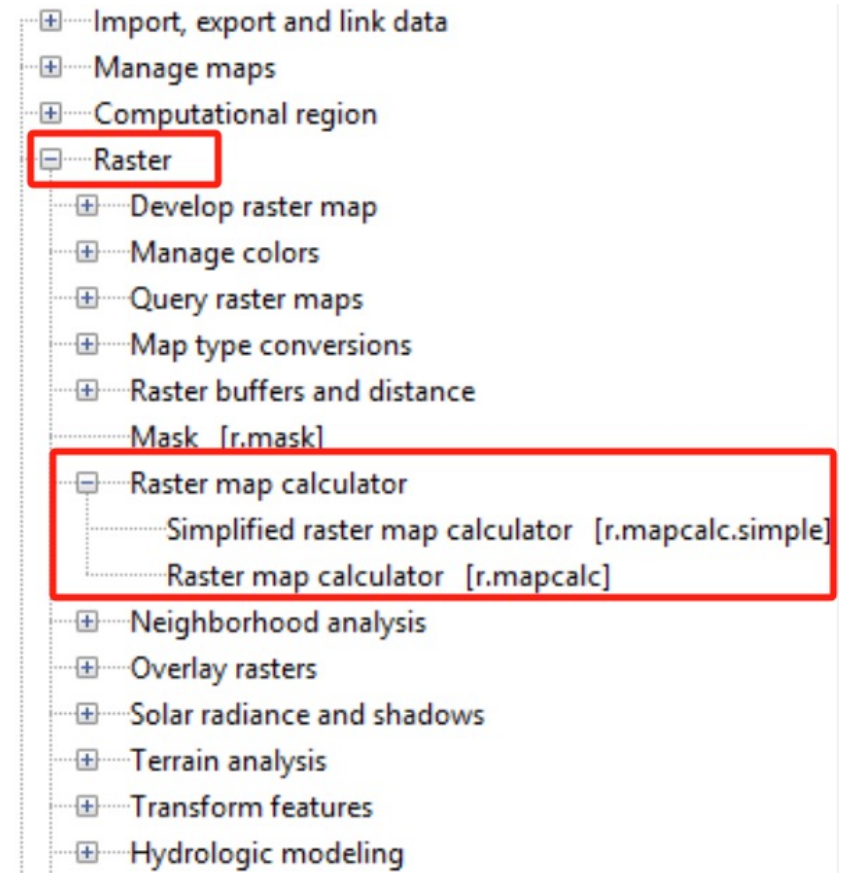

❖ Direct map expressions

- ❖ ArcGIS Pro: Raster Calculator
- ❖ QGIS: Raster Calculator
- ❖ GRASS GIS: Raster map Calculator

→ Raster layers are written as variables in expression

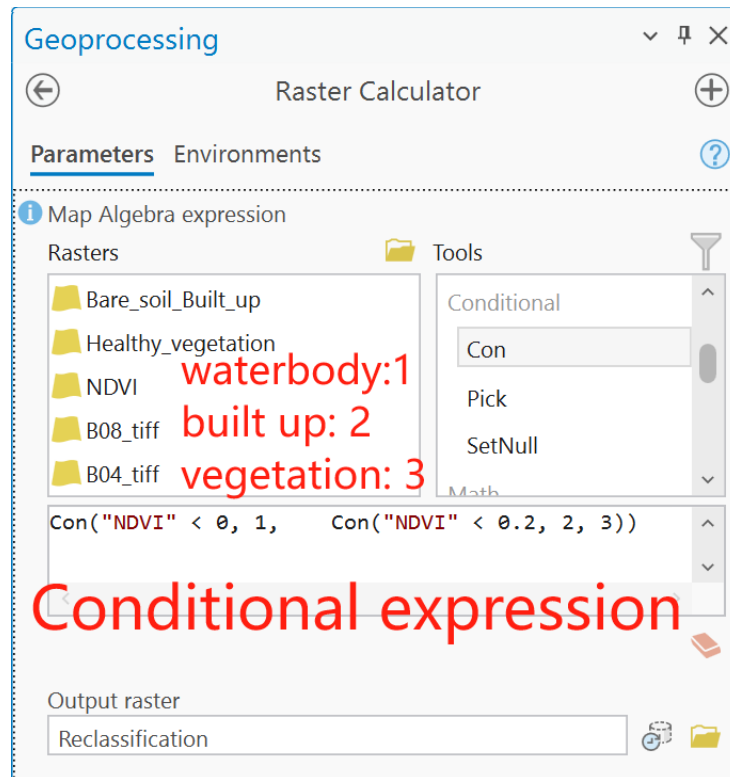

❖ Supports:

- ❖ Mathematical operations
- ❖ Logical expression
- ❖ Boolean expression
- ❖ Conditional expression

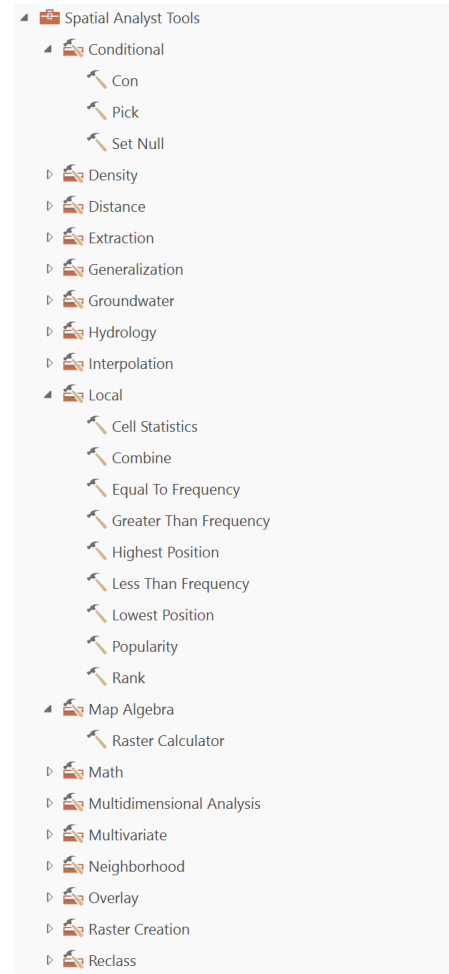

Expression-based implementation

❖ Example:

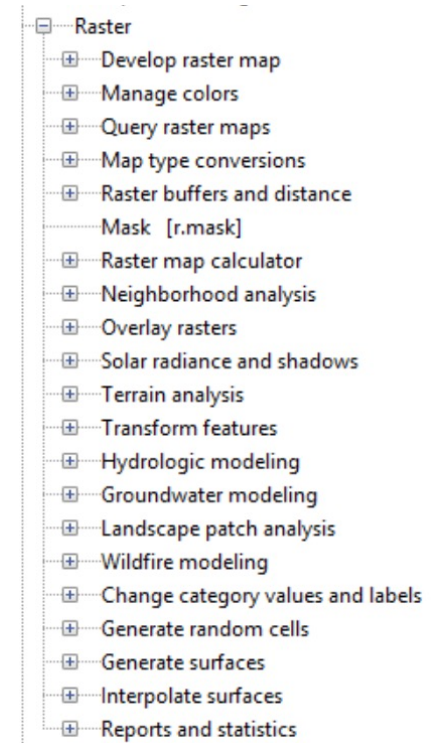

Pre-structured implementation (tool-based implementation)

- ArcGIS Pro:
 - Reclassify
 - Cell statistics
 - Focal statistics
 - Zonal statistics
 - Slope
 - Aspect
 - ...
- Open-source examples:
 - QGIS Processing tools
 - GRASS raster modules

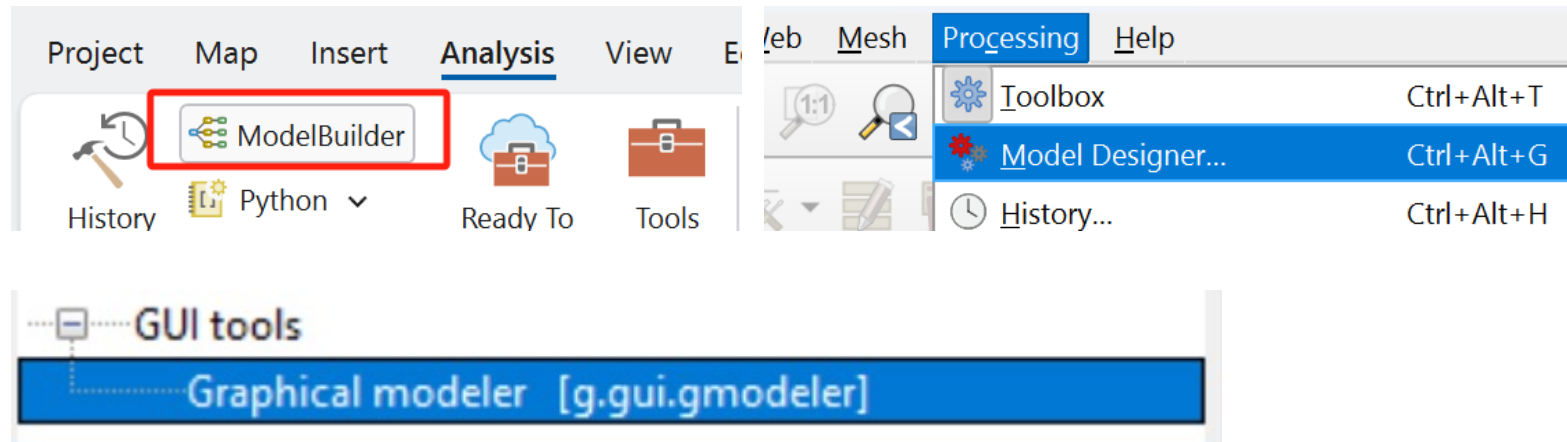

- ▶ Raster analysis
- ▶ Raster creation
- ▼ Raster terrain analysis
 - Aspect
 - DTM filter (slope-based)
 - Fill sinks (Wang & Liu)
 - Hillshade
 - Hypsometric curves
 - Relief
 - Ruggedness index
 - Slope
 - Total curvature
- ▶ Raster tools

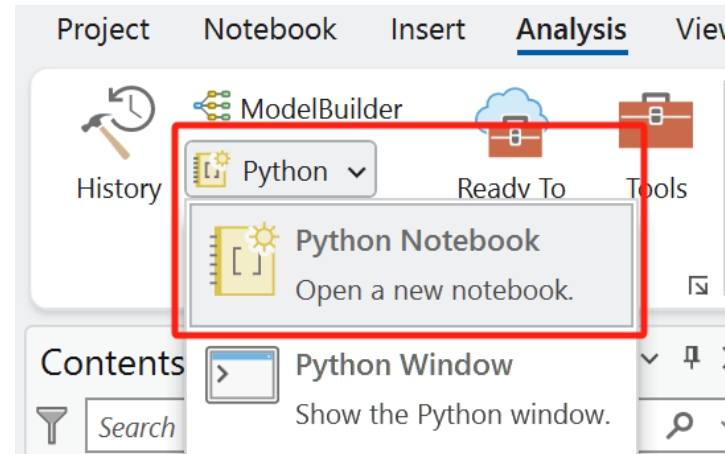

Workflow-based implementation

- Multiple raster operations can be chained into structured workflows
 - ArcGIS Pro: ModelBuilder
 - QGIS: Model Designer
 - GRASS: Graphical Modeler
-
- Useful for:
 - Building structured analytical workflows
 - Making raster analysis reproducible
 - Suitable for non-programmers

Script-based implementation

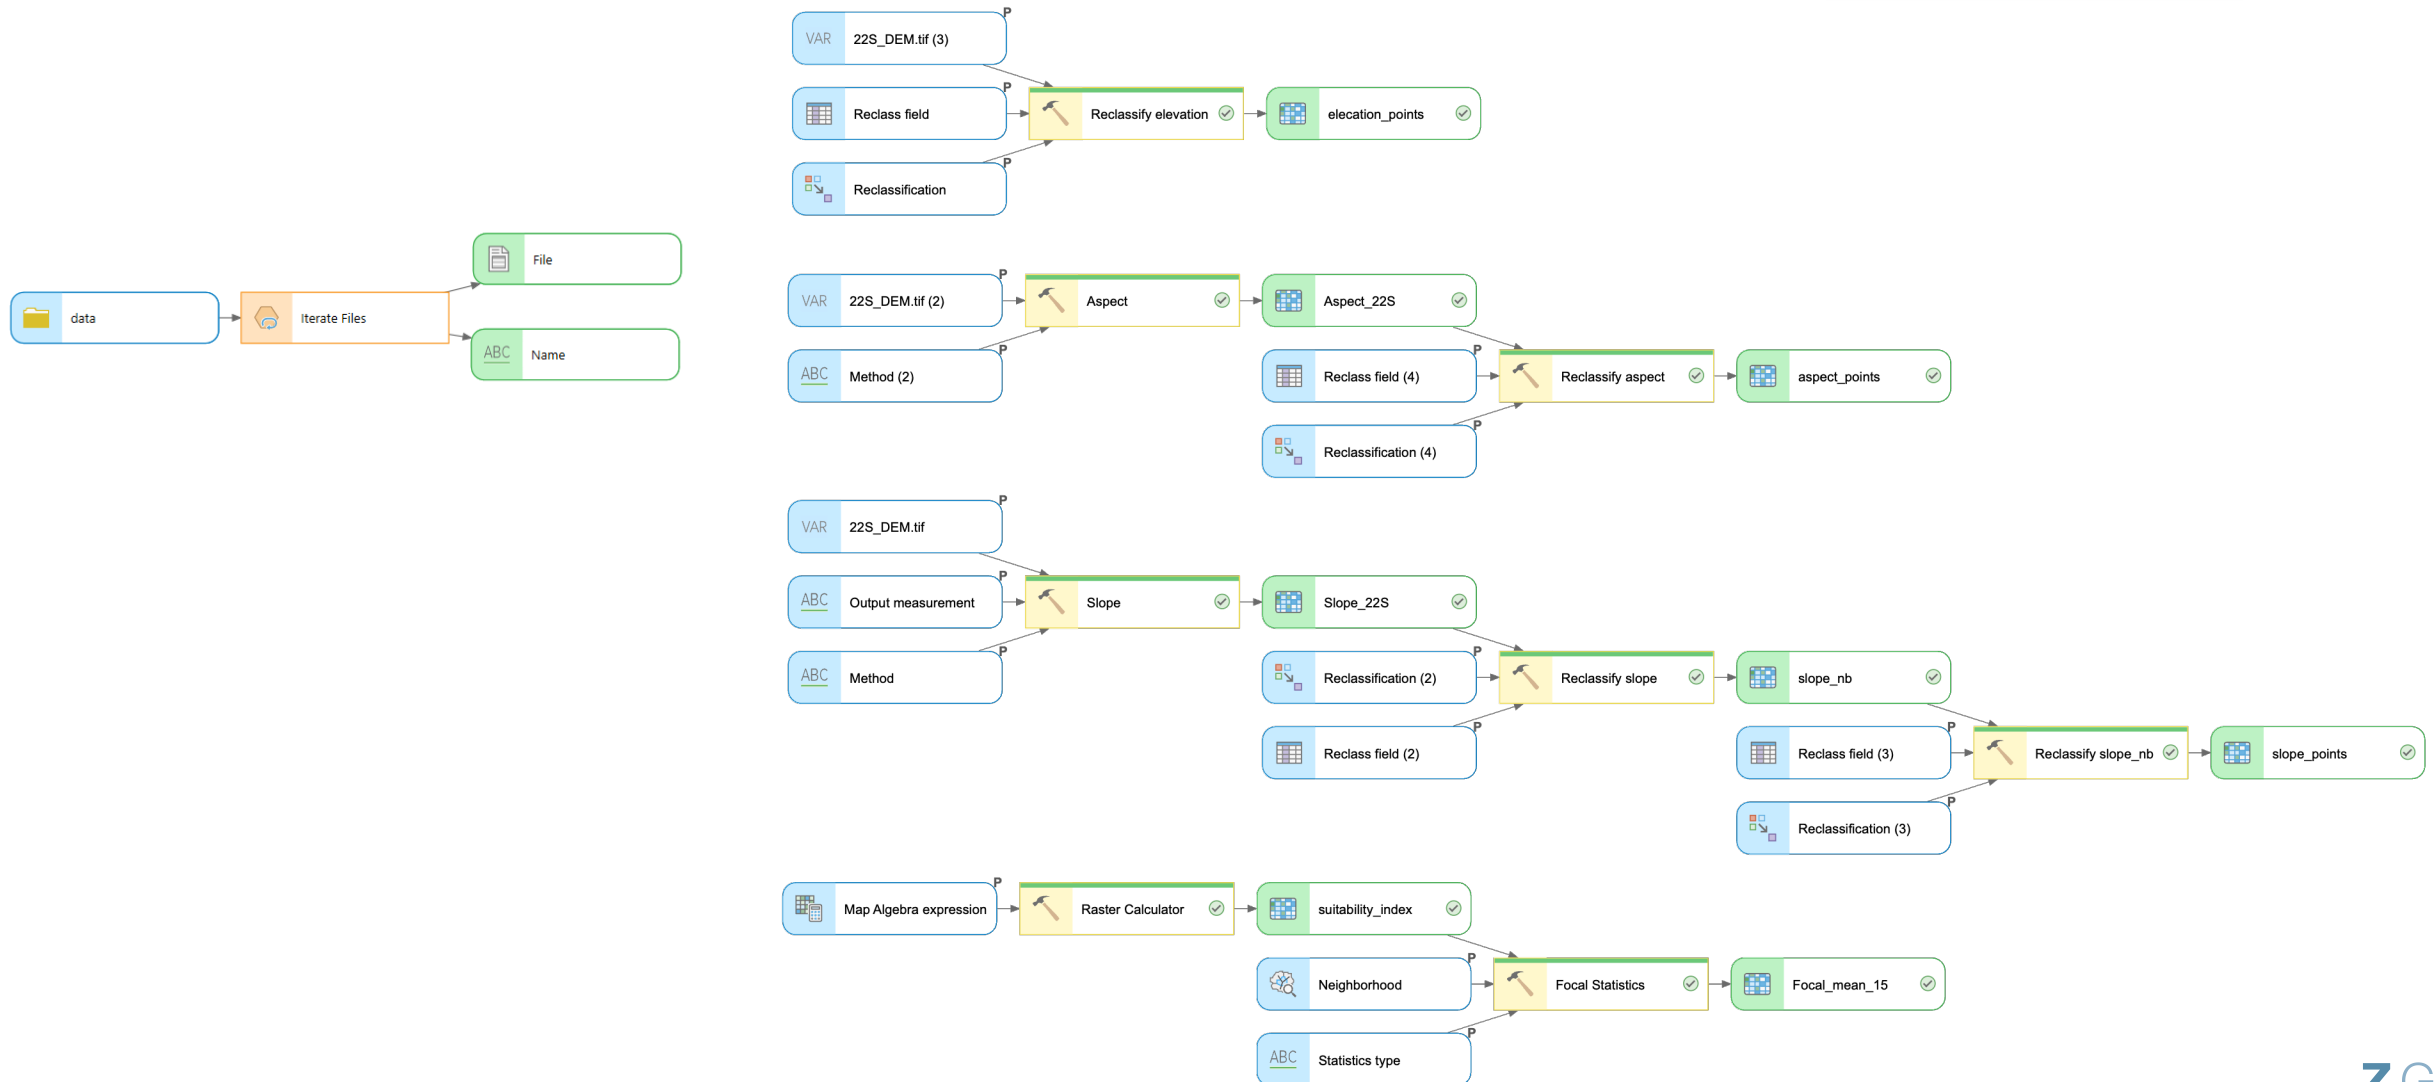

- move raster operations into code
- Supports:
 - Loops
 - Batch processing
 - Automation of repetitive analyses
 - Parameter control
 - Reproducibility
- ArcPy: ArcGIS Pro's API
- Open-source Python:
 - PyQGIS
 - GDAL-based scripting
 - Numpy
 - Rasterio
 - Rioxarray / xarray

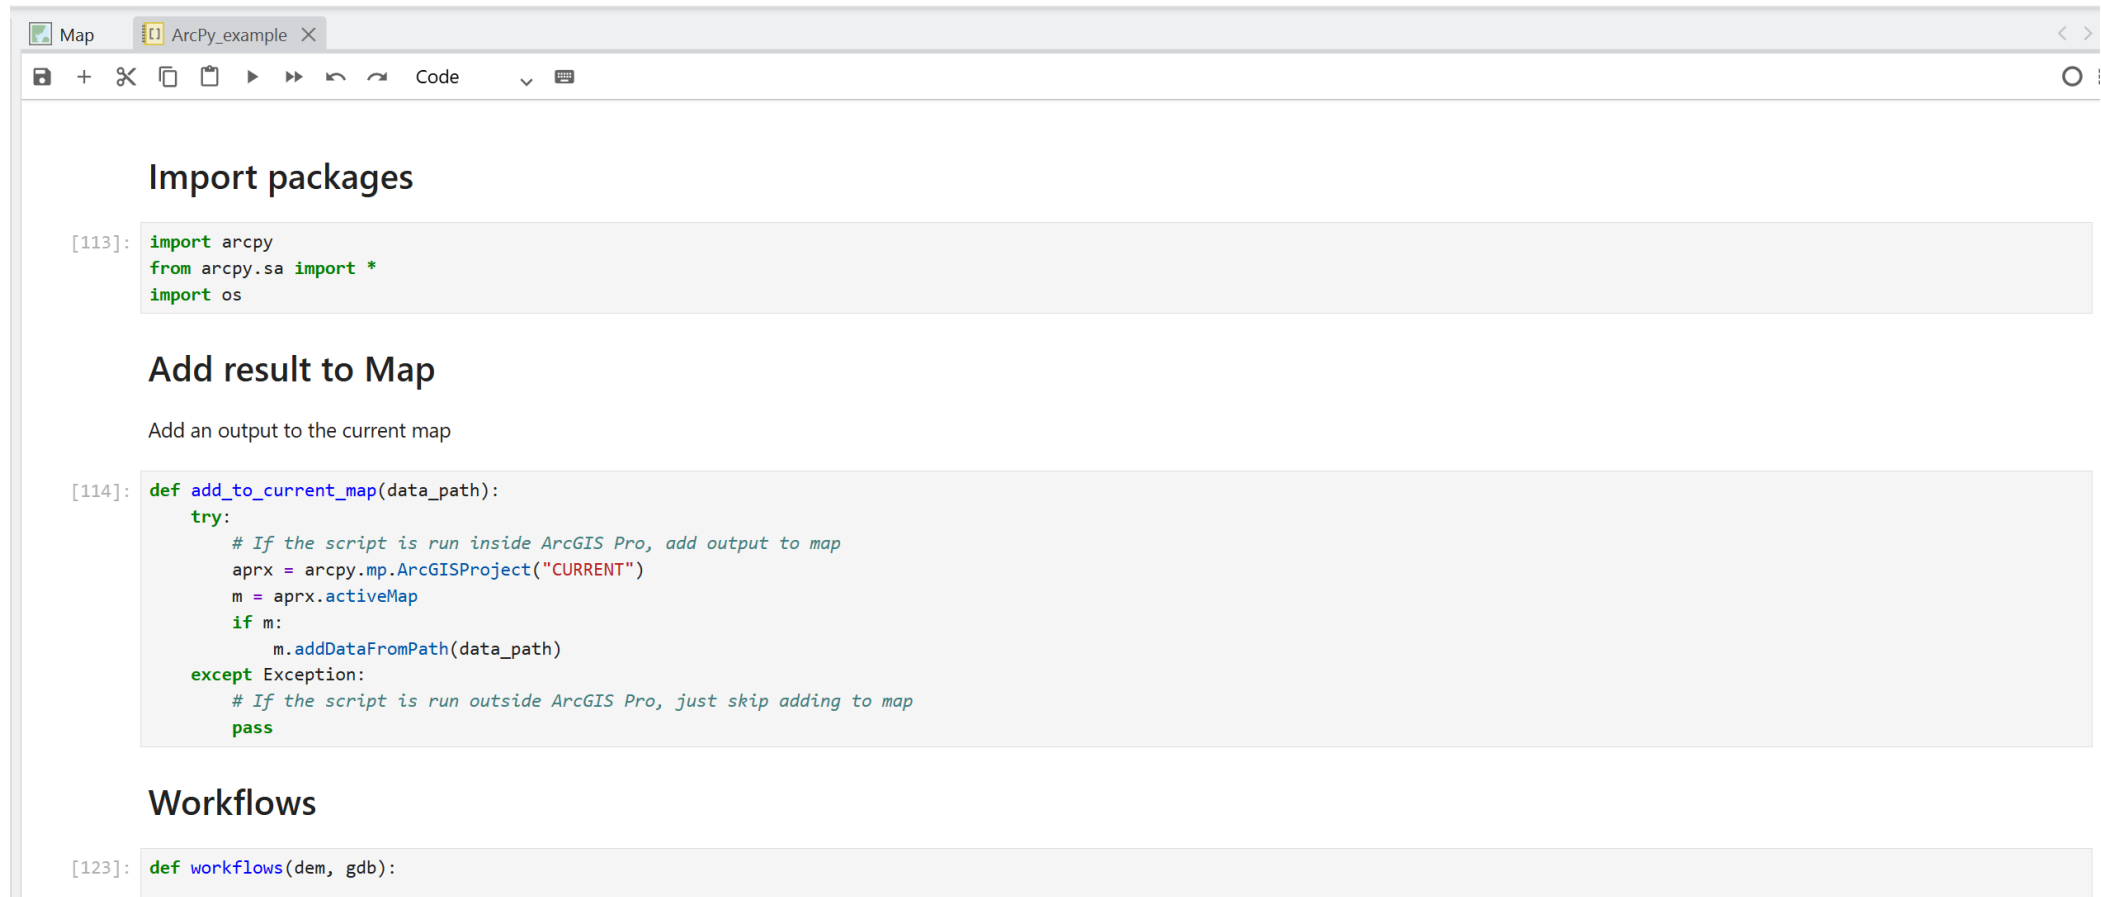

```

C: > Users > Liyan > Desktop > demo.py
1  import numpy as np
2  import rasterio
3  import xarray as xr
4  import rioxarray as rxr
5
  
```

Example: ModelBuilder vs. ArcPy

Example: ModelBuilder vs. ArcPy

```
Map ArcPy_example X
+ ✂ 📄 ▶ ▶ ▶ ⏪ ⏩ Code
[113]: import arcpy
      from arcpy.sa import *
      import os

Add result to Map
Add an output to the current map
[114]: def add_to_current_map(data_path):
      try:
          # If the script is run inside ArcGIS Pro, add output to map
          aprx = arcpy.mp.ArcGISProject("CURRENT")
          m = aprx.activeMap
          if m:
              m.addDataFromPath(data_path)
      except Exception:
          # If the script is run outside ArcGIS Pro, just skip adding to map
          pass

Workflows
[123]: def workflows(dem, gdb):
```

Workflow-based vs. Script-based

- Workflow-based implementation
- Strength:
 - Visual and intuitive workflow design
 - Integrates directly with ArcGIS geoprocessing tools
 - Easy to understand for **non-programmers**
 - Good for **demonstrating** analytical logic
 - Convenient for relatively simple workflows
- Limitations:
 - **Less flexible** for **complex conditions and custom logic**
 - Batch processing is possible, but often requires iterators and careful variable setup
 - **Output naming and file management**
 - Large models may become difficult to maintain and debug

Workflow-based vs. Script-based

- Script-based implementation
- Strength:
 - **Highly flexible** for automation and batch processing
 - Can **iterate** through folders and datasets **automatically**
 - **Output names** can be generated **dynamically** to **avoid overwriting**
 - Easier to include **conditional logical, loops, and error handling**
 - Better suited for reproducible and scalable workflows
- Limitations:
 - Requires **programming knowledge**
 - **Not intuitive** compared to a visual model
 - Harder for beginners to learn and debug
 - Scripts need more management of parameters and environments

Why open-source implementation matters

- No license barriers
- Accessible for teaching and research
- Transparent and reproducible
- Map Algebra is not tied to one software vendor
- Supports portability and broader adoption

Thank you for your attention!
